## General information

### Sliding foils

Sliding foils are mainly used for consoles and pillars with small rotation demand.

To chose the right product especially load, rotation and lifetime have to be considered.

With growing span lenght the rotation will increase.

It has to be taken into account that a higher load will reduce the possible rotation value.

The chart below gives a rough overview about the HEIM product range.

HEIM sliding foils are designed and produced in Germany according to highest quality demands.

The main foil types are externally tested and approved by a German MPA testing facility.

HEIM elastomeric sliding bearings like Typ Z are a cost effectice solution for consoles with higher rotation

The original german languaged test reports can be handled out on demand.
